

VIEW '26: Official Rules, Guidelines & Timeline

Organized by IEEE Student Branch, Academy of Technology

1. General Eligibility & Registration

- **Participation:** Open to all undergraduate students of the Academy of Technology (AOT).
- **Team Structure:** Exactly 2 members per team. Cross-department and cross-year teams are permitted and encouraged.
- **Registration:** All teams must register via Google form and pay the nominal registration fee of ₹50/-. Registration must be completed before the commencement of Round 1.
- **Platform:** Problem statements, submission portals, and major announcements will be informed via Mail of the team lead.

2. Official Event Timeline

Date & Time	Event / Action
May 16 6:00 PM	Round 1 Notification: The VIEW round officially begins. Scenario-based problem niches are released to all registered teams.
May 16 10:00 PM	Mentorship Session 1: Doubt clearing session. An interactive session to help teams break down their scenarios, choose tech stacks, and clear roadblocks.
May 17 8:00 PM	Mentorship / Speaker Session 2: A dedicated session focusing on development best practices, open-source contributions, and optimizing GitHub repositories (discussing GitHub stars).
May 17 10:00 PM	Submission Mail Dispatch: The official submission mail/links are sent to all VIEW participants.
May 18 6:00 AM	Submissions Close: The portal locks. All repositories and Round 1 deliverables must be submitted.
May 23 12:00 PM – 5:00 PM	Offline Development Finale (Round 2): Intensive 5-hour development sprint for shortlisted teams at a designated on-campus venue (TBD).

3. Round 1: Development Prototyping (Online Phase)

The Challenge: Teams will be assigned specific problem niches based on real-world scenarios. The objective is to conceptualize, architect, and begin building an MVP that directly addresses the assigned niche.

Submission Deliverables: The GitHub README

For Round 1, your code architecture is important, but your GitHub Repository Documentation is critical. Judges will evaluate your product based heavily on your README.md.

Your GitHub README must include the following:

1. The Significance & Solution (Core Requirement): A clear, detailed breakdown of your assigned scenario and exactly *how* your MVP logically and technically solves the problem. Do not just list what the app does; explain *why* it matters.
2. Tech Stack: A clean list of the frameworks, languages, and tools utilized.
3. System Architecture/User Flow: A brief visual or written explanation of how data moves through your application or how the user interacts with the UI.
4. Local Setup Instructions: Step-by-step commands on how to clone, install dependencies, and run your project locally.
5. Future Scope: What features will you be building if you qualify for the Offline Finale?

Note: Teams that submit generic code without a highly detailed, scenario-focused README will face heavy penalty points.

4. Round 2: Offline Development Finale

- **Objective:** Shortlisted teams will gather offline for an intensive 5-hour sprint to develop their functional Minimum Viable Product (MVP) based on their Round 1 submissions.
- **Hardware:** Participants must bring their own laptops, chargers, and testing devices (mobile phones/cables).
- **Code Execution:** Teams can use standard boilerplates and open-source libraries, but the core logic, UI integration, and backend linking must be built during the hackathon hours. Bringing a pre-built, fully functional app will result in disqualification.
- **Internet:** While college Wi-Fi may be available, participants are highly advised to carry personal mobile hotspots.
- **Pitching:** The sprint concludes with a live demonstration where teams pitch their MVP to the judges.

5. Judging Criteria

- **User Interface & Experience (UI/UX) (25%):** Is the application visually appealing, intuitive, and accessible?
- **Functional Completeness (35%):** Does the MVP successfully solve the chosen problem statement? Are core features bug-free?
- **Innovation & Technical Execution (20%):** Complexity of the tech stack, database optimization, and code architecture.
- **Pitch & Viability (20%):** Quality of communication regarding value proposition, target audience, and scalability during the live demo.

6. Code of Conduct & Fair Play

- **Originality:** Plagiarism is strictly prohibited. Codebases will be reviewed.
- **AI Usage:** Utilizing AI tools (like Copilot, ChatGPT, or local LLMs) for debugging or "vibe coding" is permitted. However, participants must fully understand their code. Inability to explain AI-generated architecture to judges will negatively impact scores.
- **Professionalism:** Teams must maintain a collaborative and respectful environment.
